va 0xFFFFD000 pte 0x0 pa 0x0 perm 0x0
va 0xFFFFE000 pte 0x21FD00C7 pa 0x87F40000 perm 0xC7
va 0xFFFFF000 pte 0x2000184B pa 0x80006000 perm 0x4B
print_pgtbl: OK
ugetpid_test starting
ugetpid_test: OK
print_kpgtbl starting
print_kpgtbl: OK
```

```
print_pgtbl: OK
ugetpid_test starting
ugetpid_test: OK
print_kpgtbl starting
print_kpgtbl: OK
```

Which other xv6 system call(s) could be made faster using this shared page? Explain how.

getpid(), which fetched parent processes' pids could be made much faster through a shared page because it will be able to avoid 'round trips' to the kernel through ecalls. By allocating a field in the shared page, the kernel would be able to only update it during rare events. When getpid() is called, the wrapper function would read the value directly. We won't need to switch between user and kernel mode.

### 3. Print a page table

```
samanwaseem@DESKTOP-5H31PUS: ~/xv6-labs-2025
xv6 kernel is booting
hart 2 starting
hart 1 starting
init: starting sh
$ print_kpgtbl
page table 0x0000000087f22000
..0x0000000000000000: pte 0x0000000021fc7801 pa 0x0000000087f1e000
.. ..0x0000000000000000: pte 0x0000000021fc7401 pa 0x0000000087f1d000
.. .. ..0x0000000000000000: pte 0x0000000021fc7c5b pa 0x0000000087f1f000

.. ..0x000000001ffff000: pte 0x0000000021fc8001 pa 0x0000000087f20000
.. .. ..0x000000001fffffff0: pte 0x0000000021fd00c7 pa 0x0000000087f40000
.. .. ..0x000000001fffffff8: pte 0x000000002000184b pa 0x0000000080006000
$
```

'page table 0x0000000087f22000' shows a top level physical address  
The indentation for the rest show levels 1 (. .) 2 (. . .) and 3 (. . . .)  
Permissions work the same way as shown in the analysis in Part 1.

Addresses are also distinguished as low or high addresses.
